Thank you for your suggestion. However, we did not carry out a correlation study in our research, as our main objective was to assess the practices of Moroccan doctors with regard to maternal and childhood obesity. Our investigation aimed to understand and highlight gaps and areas for improvement in the management of these problems, in order to best prevent childhood obesity resulting from maternal obesity. By focusing on this approach, we were able to provide more targeted recommendations for improving clinical practices and public health policies in this area, rather than focusing on correlations between different variables.
