

Supplementary Figure S1. Mdivi-1 administration ameliorated lung injury and promoted the 24-hour overall survival rate after intestinal I/R in mice.

(A, B) Lung tissue injury was detected by H&E staining and evaluated by Mikawa's score (scale bar=100 μ m). (C) Survival rate of the mice (n=15 mice per group). ^a p <0.05 compared with the vehicle group; ^b p <0.01 compared with the sham group; ^c p <0.05 compared with the I/R group. I/R: ischemic/reperfusion.
