Impact of sustained virologic response on chronic kidney disease progression in hepatitis C

Elizabeth S Aby, Tien S Dong, Jenna Kawamoto, Joseph R Pisegna, Jihane N Benhammou

Abstract

BACKGROUND: The prevalence of chronic hepatitis C virus (HCV) infection in Veterans is greater than 2-fold higher than the general population in the United States. Consequences of HCV infection extend beyond the liver, including an increased risk of end-stage renal disease. There is a paucity of data in the literature that investigates the effects of HCV treatment with newer direct acting antivirals (DAAs) on renal function.

AIMS: To determine how sustained virological response at 12 weeks (SVR12)
