The serum carbohydrate antigen 19-9 (CA 19-9) level has been identified as a
prognostic indicator of recurrence and reduced overall survival. The aim of this study
was to identify preoperative prognostic factors and to create a prognostic model
able to assess the early recurrence risk for patients with resectable PAC.

Jul 08, 2019 · High preoperative carbohydrate antigen (CA) 19.9 is a representative risk factor of ER
(13-16), but its predictive ability is not always sufficient, and no other reliable risk factors have been
identified. Here, we examined predictive risk factors for ER in PDA patients submitted for macroscopic
curative pancreatectomy.

Jan 06, 2011 · There are few studies about preoperative predictive factors for the recurrence of BTC, but in
pancreatic cancer, several studies have shown the correlation between preoperative serum levels of
the carbohydrate antigen (CA) 19-9 and the rate of recurrence after curative resection.8–10 CA 19-9
is the anti-blood group antibody, which is produced by bile duct epithelium and detects circulating ...
