ABOUT COVER

Editorial Board Member of World Journal of Clinical Cases, Youngmin Oh, MD, PhD, Associate Professor, Neurosurgeon, Department of Neurosurgery, Jeonbuk National University Medical School/Hospital, Jeonju 54907, Jeollabukdo, South Korea. timoh@jbnu.ac.kr

AIMS AND SCOPE

The primary aim of World Journal of Clinical Cases (WJCC, World J Clin Cases) is to provide scholars and readers from various fields of clinical medicine with a platform to publish high-quality clinical research articles and communicate their research findings online.

WJCC mainly publishes articles reporting research results and findings obtained in the field of clinical medicine and covering a wide range of topics, including case control studies, retrospective cohort studies, retrospective studies, clinical trials studies, observational studies, prospective studies, randomized controlled trials, randomized clinical trials, systematic reviews, meta-analysis, and case reports.

INDEXING/ABSTRACTING

The WJCC is now abstracted and indexed in Science Citation Index Expanded (SCIE, also known as SciSearch®), Journal Citation Reports/Science Edition, Current Contents/Clinical Medicine, PubMed, PubMed Central, Scopus, Reference Citation Analysis, China National Knowledge Infrastructure, China Science and Technology Journal Database, and Superstar Journals Database. The 2022 Edition of Journal Citation Reports® cites the 2021 impact factor (IF) for WJCC as 1.534; IF without journal self cites: 1.491; 5-year IF: 1.599; Journal Citation Indicator: 0.28; Ranking: 135 among 172 journals in medicine, general and internal; and Quartile category: Q4. The WJCC’s CiteScore for 2021 is 1.2 and Scopus CiteScore rank 2021: General Medicine is 443/826.

CASE REPORT

Congenital ovarian anomaly manifesting as extra tissue connection between the two ovaries: A case report

Myeong Gyun Choi, Jong Woon Kim, Yoon Ha Kim, A Mi Kim, Tae Young Kim, Hyun Kyung Ryu

**Specialty type:** Obstetrics and gynecology

**Provenance and peer review:** Unsolicited article; Externally peer-reviewed.

**Peer-review model:** Single-blind

**Abstract**

**BACKGROUND**

Ovarian anomalies except for uni- or bilateral streak gonads are rare. We present a rare case of an ovarian anomaly in which both ovaries were connected by extra tissue.

**CASE SUMMARY**

A 32-year-old, primipara with a twin pregnancy at 36 weeks of gestation was admitted to the hospital with severe preeclampsia. She underwent emergency cesarean section owing to persistent headache, blurred vision, and general edema. Following a peritoneal incision, a thin rectangular-shaped tissue was seen in front of the uterus. After delivery, the extra tissue was removed; no other anomalies were reported in either the ovaries or uterus. Pathology results of the removed tissue disclosed a well-vascularized loose stromal tissue with few follicles and scattered luteinized cells. In this case, to prevent pelvic adhesion or intestinal obstruction resulting from volvulus, strangulation, and torsion, the extra tissue was removed.

**CONCLUSION**

We report a case of a rare ovarian anomaly where both ovaries were connected by extra tissue. If the extra tissue extends to the abdominal cavity, it should be removed to prevent pelvic adhesion or abdominal complications including intestinal volvulus, strangulation, and torsion.

**Key Words:** Connected ovaries; Extra tissue; Ovarian anomaly; Case report

**INTRODUCTION**

Several ovarian anomalies have been reported. Among them is ovarian absence; in phenotypic females, the absence of both ovaries is generally linked to chromosome abnormalities and gonadal dysgenesis syndrome. In this case, individuals are likely to have streak gonads or underdeveloped gonads, which are a risk factor for malignancy[1]. Congenital unilateral ovarian agenesis in a normal female is extremely rare and asymptomatic in most cases. Ipsilateral renal or ureteric agenesis and/or ipsilateral malformation of the fallopian tube may be accompanied by congenital unilateral ovarian agenesis. The etiology of unilateral ovarian agenesis has yet to be explained. The two most likely causes of unilateral ovarian agenesis are an asymptomatic torsion of the ovary with consequent organ ischemia and reabsorption or a defect in the development of the Mullerian and gonadal structures underlying vascular anomalies[2]. Another example of ovarian anomalies is ectopic ovaries; whether accessory or supernumerary, ectopic ovaries are also extremely rare, 1 in 29000 to 1 in 70000 gynecologic admissions[3], and may be associated with other congenital genitourinary abnormalities[1]. An accessory ovary contains ovarian tissue and is usually connected to a normal ovary. In contrast, supernumerary ovaries are not attached to the ovary but may be found at various sites in or outside the pelvis. In this report, we present a rare case of an unreported anomaly in which both ovaries were connected by extra tissue.

**CASE PRESENTATION**

**Chief complaints**
A 32-year-old female presented with high blood pressure.

**History of present illness**
The primipara woman with a twin pregnancy at 36 weeks of gestation was admitted to the hospital with high blood pressure and proteinuria. Her blood pressure was 160/100 mmHg, while laboratory test results showed 3+ proteinuria. The pregnancy followed a successful *in vitro* fertilization-embryo transfer.

**History of past illness**
The patient had no history of past illness.

**Personal and family history**
The patient had no specific history of genetic diseases.

**Physical examination**
She underwent emergency caesarean section owing to persistent headache, blurred vision, and general edema. Following a peritoneal incision, a thin rectangular-shaped tissue was seen in front of the uterus (Figure 1); it formed a connection between the two ovaries (Figure 2). We displaced this tissue, incised the uterus, and delivered the fetuses.

**Laboratory examinations**
There were no specific findings related to laboratory examinations.

**Imaging examinations**
There was no specific findings observed on imaging examinations.
FINAL DIAGNOSIS
Congenital ovarian anomaly manifesting as an extra tissue connection between the two ovaries.

TREATMENT
After delivery, we set the margins of both ovaries to avoid injuring the normal ovaries. First, both ends of the extra tissue were ligated and excised. Then the extra tissue was removed; no other abnormal findings were observed in both the ovaries and uterus. We explored the lower abdomen as much as possible to check for extra ovary tissues and any other malformations such as renal anomalies, but there were no specific findings. Pathology results of the removed tissue disclosed a well-vascularized loose stromal tissue with few follicles and scattered luteinized cells (Figure 3).

OUTCOME AND FOLLOW-UP
After surgery, the patient recovered and was discharged on the third postoperative day. During an outpatient follow-up after one month, the patient had no abdominal symptoms and ultrasonography revealed no abnormal findings on both adnexa.

DISCUSSION
Several studies have reported numerous cases of ovarian anomalies including bilateral and unilateral ovary absence, accessory, and supernumerary ovary. However, there are no reports on cases of connected ovaries, and to the best of our knowledge, this is the first case report. Our patient was...
admitted to the hospital with severe preeclampsia. She did not present other symptoms such as abdominal pain or pelvic pain and the pregnancy followed a successful in vitro fertilization-embryo transfer. She underwent an emergency caesarean section owing to severe headache, blurred vision, and general edema. A tissue connection between both ovaries was discovered by chance. In vitro fertilization is associated with several complications including ovarian hyperstimulation syndrome (characterized by swollen and painful ovaries), which results from the use of injectable fertility drugs, such as human chorionic gonadotropin (HCG)\[4\]. However, there seems to be no association between connected ovaries and ovulation induction complications. The extra tissue attached to an ovary may be asymptomatic and is not associated with infertility. In most cases, it may be left untreated with observation. However, as in the present case, if both ovaries are connected and a rectangular-shaped tissue lies in the abdominal cavity, this extra tissue can cause pelvic adhesion or intestinal volvulus, strangulation, and torsion resulting in intestinal obstruction\[5\]. Therefore, the extra tissue should be removed.

CONCLUSION

Herein we report the case of a rare ovarian anomaly where both ovaries were connected by extra tissue. In this case, to prevent pelvic adhesion or intestinal obstruction resulting from volvulus, strangulation, and torsion, the extra tissue was removed.
