Consequences of bullying victimization in childhood and adolescence: A systematic review and meta-analysis

Sophie E Moore, Rosana E Norman, Shuichi Suetani, Hannah J Thomas, Peter D Sly, James G Scott

Abstract

Objective: To identify health and psychosocial problems associated with bullying victimization and conduct a meta-analysis summarizing the causal evidence.

Method: A systematic review was conducted using PubMed, EMBASE, ERIC and PsycINFO electronic databases up to 28 February 2015. The study included published longitudinal and cross-sectional articles that examined health and psychosocial consequences of bullying victimization. All meta-analyses were based on quality-effects models. Evidence for causality was assessed using Bradford Hill criteria and the grading system developed by the World Cancer Research Fund.
