COMMENTS TO AUTHORS

This is very well written and also very interesting article from a pathophysiological point of view, but also interesting and useful for clinicians and is worthy of publication.

COMMENTS TO AUTHORS

This is a good and interesting review about IL-22, one of the immunological factors participating in acute pancreatitis. In my opinion, the redaction of own experimental results could be improved for a better understanding.

COMMENTS TO AUTHORS

Evaluation. Review article: This is an interesting review of the utility of IL-22 in acute pancreatitis, based on research conducted on animal models. The data obtained are biochemical and cellular mostly, although the topic is of great interest, the article could be improved as follows: In the introduction, you should explain that there are two problems in the management of the PA. First problem, there is no way to predict the clinical course in the early hours of evolution, and IL-22 could be of interest in this field. This aspect has not been developed at work, and I think that would be an area of interest. Second problem, there is no treatment to stop the inflammation and subsequent pancreatic necrosis, and IL-22 may be useful. Writing laboratory findings is unclear, you should try writing for readers who do not work in basic research. Finally, I think these therapeutic and diagnostic options are tested in animal models, have failed in the attempt to apply or use in human clinical practice and this could be another similar case with IL-22.
