COMMENTS TO AUTHORS

The paper is well described and contains an useful clinical information. The tables must be rewritten including the median values and standard deviations in the same column and the IQ interval in other separate column.

COMMENTS TO AUTHORS

Your study is interesting and it gives new information about the treatment of severe gastroduodenal perforations. However, english revision and some corrections shown below are needed before the final decision about its acceptance for publication. 1.In material and methods, in the page 4, it is better to take away the second aim of the study, because no T-tube drainage was used allthough it was the meaning to use it. 2. Why did you not use feeding jejunostomy as a route for enteral nutrition before hearing bowel sounds? It is well known that enteral nutrition is better than intravenous nutrition and it can be started soon, because it locates well below the area of perforation 3.in the section of discussion in the page 9, put last 2 sentences to the section of results.
