Published: 2019

May 30, 2019 Background—Cardiopulmonary bypass and cardiac surgery are associated with a significant systemic inflammatory response that may increase postoperative complications. This meta-analysis assessed whether the benefits and risks of corticosteroid use were dose-dependent in cardiac surgery. Methods and results—Randomized controlled trials of the use of corticosteroid...

No beat and holds to treat? Corticosteroids in cardiac ...

April 22, 2023 “Corticosteroid supplementation during CPR may be beneficial in improving outcomes by mitigating the stress. The number of clinical studies investigating the role of corticosteroids in improving the outcomes of cardiac arrest are limited and heterogeneous in terms of their design, agents used and patient populations.”

Clinical benefits of corticosteroid administration during adult cardiopulmonary resuscitation: a systemic review and meta-analysis

Abstract

BACKGROUND

The clinical benefits of steroid administration during cardiac arrest remain unclear. Several studies reported that patients who received steroids after achieving a return of spontaneous circulation (ROSC) had better outcomes, but few studies have investigated the benefits of steroid administration during resuscitation. We hypothesized that administration of steroids during cardiac arrest would be associated with better clinical outcomes.
