**SPECIFIC COMMENTS TO AUTHORS**

This is a very interesting paper utilizing AI to evaluate the risk of recurrence in the case of HCC. Could the authors please respond to the following questions/comments: 1) Is there an inherent bias since the fact that these were all cases going to surgery first meant more limited disease? 2) Have the authors compared or are they planning to compare/validate their model with other existing ones?

Despite being a novel piece of work, it presents certain challenges that may hinder the reader's ability to fully understand its main point. These challenges stem from both technical jargon and limitations in the English language. Below are some examples of these obstacles: My Comments and Suggestions to Authors: 1- In my view, the abstract is overly cumbersome and difficult to extract the main point. It would be helpful to include more detailed keywords to enhance clarity. 2- Please proofread the manuscript carefully, paying particular attention to grammatical errors, and improve the formatting of the text, figures, and tables as needed. 3- The contributions made in this manuscript may not be adequate for publication in this journal. Therefore, I strongly recommend that the authors clearly define and elaborate on their contributions. 4- The proposed method and experiments are not clearly illustrated. 5- The Results and Discussion section of the paper appears inadequate and requires more attention, with a need for better explanation and elaboration. 6- The conclusions in this manuscript are primitive. Write your conclusions. 7- Please explain the proposed method in more details, what is the novelty of the proposed method compared to the state of the art?
