### COMMENTS TO AUTHORS

In this manuscript, the authors provided an overview of the current research progress and prospects of surface markers for liver cancer stem cells. Liver cancer is the fifth most common and third most deadly cancer in the world and HCC accounts for 90% of liver cancers. liver cancer stem cells have been highly researched in liver cancer for more than 10 years, and are considered to be a population of cells with certain stem cell-like characteristics in liver cancer tissue. LCSC markers have not been recognized until now, and the current problem is determination of liver cancer stem cells-specific markers for identification, separation and cultivation of liver cancer stem cells. Tables are interesting, and the references are updating.
