Abstract

39
Acute pancreatitis is a necro-inflammatory disease of the exocrine pancreas that
is characterized by inappropriate activation of zymogens, 13
infiltration of the
pancreas by inflammatory cells, and destruction of the pancreatic exocrine cells.
Acute pancreatitis can progress to a severe life-threatening disease. Currently
there is no pharmacotherapy to prevent or treat acute pancreatitis. 16
One of the
more common factors associated with acute pancreatitis is alcohol abuse.
Although commonly associated with pancreatitis alcohol alone is unable to cause
pancreatitis. Instead, it appears that alcohol and its metabolic by-products
predispose the pancreas to damage from agents that normally do not cause
pancreatitis, or to more severe disease from agents that normally cause mild
pancreatic damage. 2
Over the last 10 to 20 years, a tremendous amount of work
has defined a number of alcohol-mediated biochemical changes in pancreatic
