## COMMENTS TO AUTHORS

This manuscript entitled “A review of laser and light therapy in the treatment of functional ophthalmic pathology” was to review the laser and light therapy modalities to treat oculo-facial pathology included the use of intense pulsed light (IPL) and photodynamic therapy (PDT), light-emitting diode devices, as well as ablative and non-ablative lasers. They concluded that understanding appropriate usage, side effects, and outcome is before treating functional and cosmetic issues. This is an interesting, however, authors seems did not categorize and analyze very well. It seems can't offer us an important information to authors. I suggest authors to modify the Table 1 as 5 categories: IPL, PDT, Ablative lasers, Non-ablative lasers, and Fractionated Laser Devices. Then add the type of laser or light underlie. Besides, I hope author can add advantages and disadvantages of each instruments behind application.

## COMMENTS TO AUTHORS

The article is a well written concise review of application of lasers as an alternative to the traditional medical and surgical treatments. It gives a new approach to treatment of pathologies in periorbital area like depigmentation, telangiectasis etc. It gives a broad view of the types of lasers available and the variety of conditions they can be used for. The topic of interest is a relatively new area and has a lot of scope. The title and abstract aptly outline the intended discussion. The article can be made more descriptive and informative by outlining in detail the indications of each type of laser and also the absolute and relative contraindications. It can be made more useful for the clinicians if a note on the incidence and management of possible complications is made and also if the safety measures for the use of lasers are outlined. It will also be more appealing if any studies done in the respective areas are quoted and clinical photographs are added in the manuscript.

## COMMENTS TO AUTHORS

The manuscript entitled "A review of laser and light therapy in the treatment of functional ophthalmic pathology" is a well written, concise review of the treatment of oculo-facial pathology, such as vascular lesions, dyspigmentation, scars, ect. by use of non-surgical methods. The authors give brief description of the usage, possible side effects and outcomes of the treatment with intense pulsed light (IPL) and photodynamic therapy (PDT), light-emitting diode devices, as well as ablative and non-ablative lasers. It is a short, interesting and informative manuscript. I have only one comment and suggestion: little change in the title - "functional ophthalmic pathology" means that the authors would comment on ocular function. I suggest - "A review of laser and light therapy in the treatment of oculo-facial pathology".
