SPECIFIC COMMENTS TO AUTHORS
The Introduction is rather short. Possibly authors could add some more epidemiological information. Additionally, perhaps the first sentence of the Discussion could be moved to the Introduction section. The sequence of pictures is very informative about the patient’s initial presentation, examination, management and recovery. In Figure 9, where the shoulder elevation is shown, have the authors considered to examine whether this loss in range shown was due to glenohumeral joint limitation or whether it was due to Upper Trapezius functional limitation. Please comment on this. Please add additional information on patient rehabilitation post discharge. For instance, was he prescribed rehabilitation or was there any advice given on how to maintain glenohumeral joint motion or/and scapular muscle function? Also, was there any sling administered post-operatively?
