ABOUT COVER
Editorial Board Member of *World Journal of Clinical Cases*, Mohsen Khosravi, MD, Assistant Professor, Department of Psychiatry and Clinical Psychology, Zahedan University of Medical Sciences, Zahedan 9819713955, Iran. m.khosravi@zaums.ac.ir

AIMS AND SCOPE
The primary aim of *World Journal of Clinical Cases* (*WJCC, World J Clin Cases*) is to provide scholars and readers from various fields of clinical medicine with a platform to publish high-quality clinical research articles and communicate their research findings online.

WJCC mainly publishes articles reporting research results and findings obtained in the field of clinical medicine and covering a wide range of topics, including case control studies, retrospective cohort studies, retrospective studies, clinical trials studies, observational studies, prospective studies, randomized controlled trials, randomized clinical trials, systematic reviews, meta-analysis, and case reports.

INDEXING/ABSTRACTING
The WJCC is now abstracted and indexed in Science Citation Index Expanded (SCIE, also known as SciSearch®), Journal Citation Reports/Science Edition, Current Contents®/Clinical Medicine, PubMed, PubMed Central, Scopus, Reference Citation Analysis, China National Knowledge Infrastructure, China Science and Technology Journal Database, and Superstar Journals Database. The 2022 Edition of Journal Citation Reports® cites the 2021 impact factor (IF) for WJCC as 1.534; IF without journal self cites: 1.491; 5-year IF: 1.599; Journal Citation Indicator: 0.28; Ranking: 135 among 172 journals in medical, general and internal; and Quartile category: Q4. The WJCC’s CiteScore for 2021 is 1.2 and Scopus CiteScore rank 2021: General Medicine is 443/826.

RESPONSIBLE EDITORS FOR THIS ISSUE
Production Editor: Xu Guo; Production Department Director: Xiang La; Editorial Office Director: Jin-Lei Wang.

Colo-colonic intussusception with post-polypectomy electrocoagulation syndrome: A case report

Abstract

BACKGROUND
Post-polypectomy electrocoagulation syndrome (PPES) can occur after colonoscopic polypectomy and is usually treated conservatively with a positive prognosis. Nevertheless, there can be cases with complications developing.

CASE SUMMARY
A 58-year-old woman, who had no previous medical history, visited the Emergency Department of another hospital with symptoms of abdominal pain and fever, 1 d after multiple colonoscopic polypectomies. An abdominopelvic computed tomography (CT) scan demonstrated colo-colonic intussusception, and she was transferred to our hospital to consider an operation. CT showed colo-colonic intussusception with PPES and no evidence of obstruction. The physical examination showed localized mild tenderness on the right sided abdomen. The patient fasted and was admitted for treatment with intravenous antibiotics (piperacillin/tazobactam 4.5 g each 8 h, ornidazole 500 mg each 12 h). After admission, the symptoms got better and a follow-up CT scan demonstrated resolution of the PPES and intussusception. The patient was discharged on hospital day 9.

CONCLUSION
Colo-colic intussusception can occur with PPES, and it can be properly treated conservatively.
INTRODUCTION

Colonoscopy is the golden standard for colorectal cancer screening. Polypectomies performed during colonoscopies are generally safe. Post-polypectomy electrocoagulation syndrome (PPES) is an infrequent complication after endoscopic polypectomy. PPES is additionally an electrocoagulation injury of the colonic wall that causes a transmural burn and localized peritonitis\(^1\). Patients with PPES can develop abdominal pain and/or signs of peritoneal irritations, fever, and leukocytosis, which are like bowel perforation; however, no perforation was seen on imaging study of the abdomen\(^2\)-\(^5\). Most cases of PPES are associated with a good prognosis. Patients with less severe symptoms can be treated on an outpatient basis and rarely develop advanced complications\(^6\)-\(^8\).

CASE PRESENTATION

Chief complaints

A 58-year-old woman visited the Emergency Department of another hospital with abdominal pain and fever. Her abdominopelvic computed tomography (CT) scan demonstrated colo-colonic intussusception, and she was transferred to our hospital for considering an operation.

History of present illness

The patient had multiple colonoscopic polypectomies in the right sided colon, especially in the hepatic flexure colon. A polyp was lifted by submucosal saline injection, a polypectomy was done by electrocoagulation polypectomy (Figure 1) at another hospital 1 d before admittance, and symptoms started that night.

History of past illness

The patient had no medical history.

Personal and family history

The patient had no personal and family history.

Physical examination

The body temperature was 38 °C, heart rate was 70 bpm, respiratory rate was 20 breaths per minute, and blood pressure was 123/76 mmHg. The abdominal physical examination of the patient showed mild tenderness in the abdomen on the right side.

Laboratory examinations

Routine laboratory data demonstrated an elevated white blood cell count (11.84 × 10\(^3\)/L) with a predominance of neutrophils (83%). The erythrocyte sedimentation rate was normal at 10 mm/h, and the serum C-reactive protein was elevated at 66.18 mg/L. The blood biochemistries were normal.
Imaging examinations

An initial imaging evaluation by abdominopelvic CT revealed a target-like lesion in the right-side colon with bowel and fatty mesentery inside, which indicated colo-colonic intussusception. The lesion and proximal colon showed wall thickening with submucosal swelling and highly attenuated infiltration of adjacent pericolic fat. A transmural air bubble was in the wall of a lesion. There was no definite leading point (Figure 2A and B).

The colon lesion was further evaluated by abdominopelvic CT at hospital day (HD) 5 after the initial one, which revealed no evidence of colo-colonic intussusception. There was no colon wall thickening and no air bubble in the colon wall (Figure 2C and D).

FINAL DIAGNOSIS

The final diagnosis for the current case was colo-colonic intussusception with PPES.

TREATMENT

The patient was started on intravenous antibiotics therapy with piperacillin/tazobactam 4.5 g every 8 h, and ornidazole 500 mg every 12 h. The patient fasted and was admitted to the general surgery department.

After follow-up CT at HD 5, the patient started sips of water at HD 6. A soft-blended diet started at HD 7. The patient had no discomfort after starting the diet, and she was discharged to home at HD 9.

OUTCOME AND FOLLOW-UP

The patient was transferred to our hospital for consideration of an operation but had no surgical treatment. At a follow-up visit 2 wk after discharge, the patient was asymptomatic and had no complaints.

DISCUSSION

PPES, also known as post-polypectomy syndrome or post-polypectomy coagulation syndrome, is a relatively rare complication of polypectomy with electrocoagulation that may cause perforation or bleeding. Transmural thermal injury can happen after electrocoagulation polypectomy when electrical current is applied during polypectomy which extends into the serosa and muscularis propria. As a result, a transmural burn and localized peritoneal inflammation can occur. CT is the gold-standard imaging for PPES patients, as it shows focal mural thickening with a stratified enhancement pattern, low attenuation with perilesional submucosal edema, and high attenuated infiltration of adjacent pericolic fat without extraluminal air[9]. Up to 5 d after the colonoscopic procedure, patients can develop localized abdominal pain, fever, signs of peritoneal irritation, and leukocytosis without perforation[10].
The rate of PPES ranges from 0.003% to 0.100%, while the incidence of perforation and hemorrhage is 0.3% and 0.6%, respectively[11]. In a large multicenter study, risk factors correlated with PPES included large size of lesion (> 2 cm), non-polypoidal lesions, lesions on the right sided colon (attributed to decreased thickness of bowel wall), and hypertension[8,10]. Our patient’s multiple right-sided treated lesions featured high-risk factors. Lacking information about the shape and size of lesions, we could not find other risk factors.

There was a specific finding in our case that should be noted. Colo-colonic intussusception was present in our case without definite evidence of obstruction. A review of the literature showed that in 1214 adult patients with intussusception, 63% of adult intussusceptions were related to a tumor, where 50% of which were malignant. Further, a malignant tumor was demonstrated to be the etiology in 48% of patients with colo-colonic intussusception[12]. But our patient had a full colonoscopy and had no evidence of a remnant tumor lesion that could be a leading point. Colon wall thickening due to PPES might induce colo-colonic intussusception.

There are several ways to prevent PPES during an endoscopic procedure. First, during hot snare polypectomy, we pull the polyp toward the central area of the lumen immediately before electrocoagulation so that the submucosa is pulled away from the muscularis propria and serosa as the current is applied[13]. In addition, a hot snare, not hot biopsy forceps, is used because the hot biopsy technique increases the risk of thermal injury to the submucosa[14,15]. Second, submucosal fluid injections are used for large polyps. Elevating a large polyp by injecting saline (or an alternative solution) into the submucosa before polyp transection may reduce the incidence of PPES, but there are no large studies to substantiate this hypothesis[10,16,17]. A submucosal fluid injection before polypectomy should theoretically decrease the incidence of transmural burn by enlarging the submucosal layer[2]. Third, we could use alternative polypectomy techniques. Cold snare polypectomy is not associated with PPES, and the available data suggest that the cold snare technique may be a safe and effective option for lesions that are ≥ 1 cm, located in the right colon, or have a non-polypoid shape[18,19].

Similar to this case, Kedia et al[13] reported a case of PPES with a radiology report suggesting ileocolic intussusception. In that case, the patient’s clinical signs worsened after 24 h and the patient underwent unnecessary diagnostic laparoscopy and was, as a result, exposed to possible operation related complications unnecessarily[20]. In this case, the patient’s clinical signs got better and showed no sign of obstruction, and we managed the patient conservatively and did not consider surgical
intervention. This case demonstrates the necessity of combining the clinical scenario with radiologic findings to reach a differential diagnosis and optimal management plan.

CONCLUSION
Colo-colic intussusception can occur with PPES, and it can be properly treated conservatively.
