Current status of the diagnosis and treatment of hepatic echinococcosis

Memmet Mihmanli, Ufuk Oguz Idiz, Cemal Kaya, Uygur Demir, Ozgur Bostanci

Abstract

Echinococcus granulosus and *E. multilocularis* are the most common parasitic diseases that affect the liver. The disease course is typically slow and the patients tend to remain asymptomatic for many years. Often the diagnosis is incidental. Right upper quadrant abdominal pain, hepatitis, cholangitis, and anaphylaxis due to dissemination of the cyst are the main presenting symptoms. Ultrasonography is important in diagnosis. The WHO classification, based on ultrasonographic findings, is used for staging of the disease and treatment selection. In addition to the imaging
