Clear cell sarcoma (CCS) (also known as malignant melanoma of soft parts) is a soft tissue sarcoma of adolescents and young adults with melanocytic differentiation typically involving tendons and aponeuroses. The distal extremities, in particular foot and ankle regions, are the main sites of involvement.

Jan 13, 2017 - Clear cell sarcoma (CCS) is a rare malignant soft-tissue neoplasm that displays melanocytic markers and exhibits striking histopathological features. The tumour has a predilection for the lower extremities and rarely presents in the mediastinum. We present a case of primary mediastinal CCS in a 57-year-old man.

In conclusion, clear cell sarcoma is a rare homogeneous entity among soft tissue sarcomas showing a strong predilection for tendons and aponeuroses of the extremities. The present case is of interest because it is the first description of a pleural invasion. The treatment applied was radical excision. Follow-up observation

Abstract

BACKGROUND

Clear cell sarcoma (CCS) of soft tissue is a rare malignant soft tissue sarcoma usually reported to locate at distal end of extremities and rarely at trunk. Herein, we report a case of CCS in pleural cavity.
