Many previous papers proved that T-tubes used for biliary anastomosis can be seen responsible for many complications. Why in your case was this technique chosen? What was the quality of recipients distal bile duct in order to long lasting HAT. When was T-tube removed and what is current status of patients bile duct (TBIL level)?

This is a case report of the consequences of long term ischemia in OLT causing a biliary stricture and ultimately liver failure. It reads well and has basically proper grammar. It needs some clarifications. 1) Was the Hepatitis B active or considered cured during the 1st transplant? 2) What was the nature of the biliary stricture. Small duct or anastomotic or other? The changing of PTC stents could have caused chronic cholangitis. Did the patient have frequent biliary infections? 3) Was there a bile leak after the first surgery?
