**Parathyroid hormone-related peptide (PTHp)** exerts its effects on cells derived from colorectal cancer (CRC) and tumor microenvironment and is involved in processes requiring the epithelial-mesenchymal transition (EMT). Here, we report that PTHp modulates factors expression and morphological changes associated with EMT in HCT116 cells from CRC.

Abstract. Epithelial–mesenchymal transition (EMT) is an important process that contributes to renal fibrogenesis. TGF-B1 and EGF stimulate EMT. Recent studies suggested that parathyroid hormone–related protein (PTHp) promotes fibrogenesis in the damaged kidney, apparently dependent on its interaction with vascular endothelial growth factor (VEGF), but whether it also interacts with TGF ... parathyroid hormone-related protein (PTHp) is a paraneoplastic protein that is expressed in a wide variety of malignant and normal tissues. Its predominant functions relate to development, growth, smooth muscle tone, and calcium transport. In cancer, PTHp is best known as the mediator of the syndrome of hypercalcaemia of malignancy.
