**Shattering the castle walls: Anti-stromal therapy for pancreatic cancer**

**Ozkan Kanat, Hulya Ertas**

### Abstract

Despite the availability of potent chemotherapy regimens, such as FOLFIRINOX (5-fluorouracil, folinic acid, irinotecan, and oxaliplatin) and nab-paclitaxel plus gemcitabine, treatment outcomes in metastatic pancreatic cancer (PC) remain unsatisfactory. The presence of an abundant fibrous stroma in PC is considered a crucial factor for its unfavorable condition. Apparently, stroma acts as a physical barrier to restrict intratumoral cytotoxic drug penetration and creates a hypoxic
