Diabetes self-care in primary health facilities in India - challenges and the way forward

Saurav Basu, Nandini Sharma

Abstract

India has approximately 73 million people living with diabetes and another 37 million with prediabetes while nearly 47% of the diabetes cases are undiagnosed. The high burden of poor glycemic control and early onset of complications with associated economic costs indicates a high prevalence of poor self-management practices. It is well-

<https://www.nursinginpractice.com/article/addressing-challenges-diabetes-primary-care> ▾

– The challenges: time, money and skills – The need for more 'joined-up', long-term planning – Models of integrated care – the way forward. Until recent years, the vast majority of diabetes care was conducted in secondary care, but the first GP mini-clinics were established as far back as 1971. 1

[PDF] Primary Healthcare System of Pakistan: Challenges to ...

https://file.scirp.org/pdf/OJEMD_2016072215514638.pdf

provides insight into the primary health care system of Pakistan and highlights its deficiencies by identifying that its primary healthcare system has a poor utilization of health care services, the poor accessibility to health system and poor management of diabetes by the healthcare system, gender disparity and inequity in the health care system.

Diabetes self-care activities: A community-based survey in ...

https://www.researchgate.net/publication/225288258_Diabetes_self-care_activities_A...

Diabetes self-care activities: A community-based survey in Urban Southern India. Self-care activities with respect to diet and exercise are poor in the population studied. The self-care activities relating to blood sugar monitoring and drug adherence are good. Improving self-care behaviour among patients with diabetes in India should start with adequate targeted health education.
