Necrolytic acral erythema in a HIV/HCV coinfecting patient: A case report

Katerina G Oikonomou, Dost Sarpel, Alexandra Abrams-Downey, Adnan Mubasher, Douglas T Dieterich

Abstract

Background: Necrolytic Acral Erythema (NAE) is a rare dermatological disorder, which is associated with Hepatitis C Virus (HCV) infection or zinc deficiency. It is characterized by erythematous or violaceous lesions occurring primarily in the lower extremities. The treatment includes systemic steroids
