PET/CT Imaging in Head and Neck Oncology: An Update

Viet D Nguyen, Bundhit Tantiwongkosi, Wyatt J Weinheimer, Frank R Miller

Abstract

Cancers of the head and neck account for more than half a million cases worldwide annually, with a significant majority diagnosed as squamous-cell carcinoma (HNSCC). Imaging studies such as contrast-enhanced computed tomography (CT), magnetic resonance imaging (MRI) and 18F-2-fluoro-2-deoxy-D-glucose positron-emission tomography/computed tomography (18F-FDG PET/CT) are widely used to determine
