I believe that the authors have done an excellent job in conducting and reporting their study on regional variation in routes to diagnosis of cholangiocarcinoma in England. The study's large sample size, long study period, and comprehensive data collection methods provide a robust foundation for the analysis. The authors' use of rigorous statistical methods to control for potential confounding factors further strengthens the validity of their findings. Additionally, the study's implications for clinical practice and public health policy are significant and highlight the need for improved early detection and referral pathways for cholangiocarcinoma in England. Overall, I believe that this paper makes an important contribution to the field of gastroenterology and should be considered for publication.
