This brief study about the efficacy and safety of super-selective arterial embolization in the management of acute lower GI bleeding is very interesting. Treatment of acute lower GI bleeding using Transcatheter embolization has not reached a consensus, based on the belief that the risk of intestinal infarction in this condition is extremely high. In this point, this study is useful to the clinicians. The methods are clear, and results are informative. I suggest to accept it after a minor language editing.

This retrospective study evaluated the efficacy and safety of super-selective arterial embolization in the management of acute lower GI bleeding. This study is well designed and the results are interesting. The sample size is enough, and the methods are reasonable. The discussion is good. References are update, however, I suggest the authors to include and discuss a recent published article: Transcatheter arterial embolisation for acute lower gastrointestinal haemorrhage: a single-centre study. by Kwon JH et al, Eur Radiol. 2019 Jan;29(1):57-67. doi: 10.1007/s00330-018-5587-8 PMID: 29926205. And some minor language polishing should be take attention.
