 Simple elbow dislocations: Management, direct medical cost and clinical outcome

Michalis Panteli, Ippokratis Pountos, Nikolaos Kanakaris, Theodoros Tosounidis, Peter V Giannoudis

### Abstract

**AIM:** To evaluate the management, clinical outcome and cost implications of three different treatment regimes for simple elbow dislocations.

**METHODS:** Following institutional board approval, we performed a retrospective review of all consecutive patients treated for simple elbow dislocations in a Level I trauma centre between January 2008 and December 2010. Based on the length of elbow immobilisation (LOI), patients were divided in three groups (Group I, <2 weeks; Group II, 2-3 weeks; and Group III, >3 weeks). Outcome was considered satisfactory when a patient could achieve a pain-free range of motion  $\geq 100^\circ$  (from  $30^\circ$  to  $130^\circ$ ). The associated direct medical costs for the treatment of each patient were then calculated and analysed.
