

Statistical Review Statement

We confirm that the manuscript “*Effect of Ankle Versus Thigh Tourniquets on Post-operative Pain in Foot and Ankle Surgery: A Prospective Study*” has been statistically reviewed and that the results presented utilized appropriate and relevant statistical methods for its purpose.

Correlation analysis was utilised for assessing correlation between tourniquet sites and post-operative pain scores at different time points. All statistical analysis was performed using SPSS (version 16) with professional statistical input sought from biostatistics department, University Hospitals of Leicester, UK.
