COMMENTS TO AUTHORS

The paper is well written and detailed. However, I would make the following recommendations: 1- Rather more detailed information should be provided concerning the pathophysiology and pathology of HPS. Otherwise the paper will merely be a repetition of existing information. The addition of figures would also help make the manuscript easier to understand. 2- Little clinical information about HPS is provided. The manuscript merely refers to dyspnea, platypnea and orthodeoxia. Other clinical features, and the fact it may be asymptomatic, should be given. 3- The authors should clarify whether there is any difference compared with non-HPS patients in terms of complications during post-transplantation monitoring, such as timing of extubation.
