COMMENTS TO AUTHORS

It is an interesting case mention about a 29 y/o woman with peliosis hepatis mimicking liver tumor. Although a comprehensive review in the background and discussion section, the author should describe more detail in 1. Why an operation of cholecystectomy was performed before, for gallbladder stone or recurrent idiopathic recurrent pancreatitis? 2. The pain pattern and clinical presentation (such as pain localization, induced or relived factor, vital sign change when attack...) before this operation (liver segmentectomy) should be described more detail in the text 3. The figures of CT and MRI are good in the quality. But venous and delay phases pictures of the dynamic CT may be presented (to different diagnosis with liver abscess or hemangioma, which are enhanced in the delay phase) 4. Parts of the background section might be shifted to the discussion section (background section was too long)
