Biomarkers in nonalcoholic fatty liver disease-the emperor has no clothes?

Madhusudana Girija Sreed

Abstract

Fatty liver can be a sign of an underlying disorder but by itself it is not a disease. Nonalcoholic Fatty Liver Disease (NAFLD) is not a single disease but encompasses a spectrum of diseases. No wonder that efforts to find a highly specific and sensitive biomarker for NAFLD have not become successful. About a quarter of fatty livers develop liver inflammation (nonalcoholic steatohepatitis -NASH) and over a quarter of NASH patients develop severe fibrosis. We need biomarkers for the excess fat in liver, inflammation and fibrosis of liver. It is less likely that we could find liver sensitive
