An inflammation-related nomogram for predicting the survival of patients with cancer

Jun 26, 2018 · Europe PMC is an archive of life sciences journal literature. BACKGROUND: Emerging inflammatory response biomarkers are developed to predict the survival of patients with cancer, the aim of our study is to establish an inflammation-related nomogram based on the classical predictive biomarkers to predict the survival of patients with non-small cell lung cancer (NSCLC).

Nomograms based on clinicopathological factors and...

Abstract
Novel Prognostic Nomograms Based on Inflammation...
Purpose: Hepatocellular carcinoma (HCC) is an aggressive disease with high recurrence rate. However, current staging systems were lack of predictive capacity for HCC recurrence. We aimed to develop prognostic nomograms based on inflammation-related markers for HCC patients underwent hepatectomy.
