Transhepatic Intrajugular Portosystemic, Transjugular

Figure 1: A 61-year-old female with chronic transjugular intrahepatic portosystemic shunt (TIPS) dysfunction and systemic lupus erythematosus-induced cirrhosis presented with variceal bleeding, occluded TIPS, and an arterioportal fistula. (a) 0.018" wire from the percutaneous access into the TIPS being snared from jugular access. (b) Body floss access from the outside through liver...

Large Spontaneous Intrahepatic Arterioportal Fistula

A huge spontaneous intraportal arterioportal shunt with regurgitation through the portal vein trunk was demonstrated by computed tomography and confirmed by angiography in 2 patients with liver cirrhosis.

Rapid sequential computed tomographic scanning was very useful in the diagnosis and follow-up after arterial embolization. Early vi...
