Hepatic steatosis and fibrosis: Non-invasive assessment

Rustam N Karanjia, Mary ME Crossey, I Jane Cox, Haddy KS Fye, Ramou Njie,
Robert D Goldin, Simon D Taylor-Robinson

Abstract

Chronic liver disease is a major cause of morbidity and mortality worldwide and usually develops over many years, as a result of chronic inflammation and scarring, resulting in end-stage liver disease and its complications. The progression of disease is characterised by ongoing inflammation and consequent fibrosis, although hepatic steatosis is increasingly being recognised as an important pathological feature of
