COMMENTS TO AUTHORS

Minor concern occur; 1- Readers may want to know the aspartate aminotransferase and alanine aminotransferase values of the patient.

COMMENTS TO AUTHORS

Although the case is interesting, its presentation is too confusing. This case has the features of Primary Hepatic Amyloidosis and therefore should be presented as PHA and not as "Isolated Hepatic Amyloidosis", which term is not existent. Therefore, I suggest the authors to re-wright the case under the title of Primary hepatic amyloidosis: case report and review of the literature

COMMENTS TO AUTHORS

This is a well written interesting case report of a 42 years old woman with isolated hepatic amyloidosis. My main issue as regards this case is whether the amyloidosis is indeed isolated or the patient suffered from a systemic disease. For example, the authors report that "there was history of non-cholestatic jaundice two times in past. She was hypothyroid on supplementation since 2 years" (page 4). Is the jaundice and/or hypothyroidism irrelevant to liver amyloidosis? Moreover, what was the cause of splenomegaly? What was the type of amyloidosis according to the authors' opinion? Primary, secondary or a new one? Minor issues -there are some grammatical errors (hepatocyte atrophy-page 7, like lysosomal forms -page 8) - I suggest to explain acronyms (ESR, USG abdomen, CECT thorax, MELD points) - English need to be edited (for example "There was no evidence of primary amyloidosis as bone marrow examination was normal with normal serum and urine immunofixation electrophoresis") - Was this patient followed-up? For how long? Did colchicine work? What was the outcome?
