Abstract: Purpose: To develop and validate a prognostic nomogram for patients with intravesical recurrence (IVR) after radical nephroureterectomy (RNU) for non-metastatic upper tract urothelial carcinoma (UTUC). Methods: The clinical data of 468 patients registered in the surveillance, epidemiology and end results database between 2010 and 2015 were retrospectively analyzed.

Development and validation of prognostic nomogram for ...
Background: This study was to establish nomogram models for prognostic evaluation of early-onset gastric cancer (EOGC) in both overall survival (OS) and cancer-specific survival (CSS). Methods: EOGC patients from 2004 to 2015 were retrieved from the surveillance, epidemiology and end results (SEER) and further randomly assigned to training and validation sets.

Development and Validation of a Nomogram Prognostic ...
We developed and validated a new nomogram prognostic model for SCLC patients using a large SCLC patient cohort from the National Cancer Database (NCDB). Methods: Clinical data for 24,690 SCLC patients diagnosed from 2004 to 2011 were used to develop the nomogram prognostic model. The model was then validated using an independent cohort of 9,700 SCLC patients diagnosed from ...

Development and Validation of a Prognostic Nomogram for Gastric Cancer. 

www.iubs.com/v16p1153.htm

Abstract: The incidence of gastric cancer (GC) ranks fifth among common tumors and GC is the third leading cause of cancer-related death worldwide. The aim of this study was to develop and validate a nomogram for predicting the overall survival (OS) of patients with GC. Methods: DNA methylation (DNAm)-driven genes were identified by integrating DNAm and gene expression profiling analyses from The Cancer Genome Atlas (TCGA) GC cohort. Then, a risk score model was built based...
