SPECIFIC COMMENTS TO AUTHORS

The quality and importance of this manuscript is good, the new findings of this study are important. the new concepts that this study proposes and the new methods that this study proposed, no data that this study provided, the unique insights that this study presented, the key problems in this field that this study has solved. 1 Title. the title reflect the main subject/hypothesis of the manuscript. 2 Abstract. The abstract summarize and reflect the work described in the manuscript. 3The key words reflect the focus of the manuscript. 4 Background. The manuscript adequately describe the background, present status and significance of the study. 5 Methods. The manuscript describe methods (e.g., experiments, data analysis, surveys, and clinical trials, etc.) in adequate detail. 6 Results. The research objectives achieved by the experiments used in this study. The contributions that the study has made for research progress in this field. 7 Discussion. The manuscript interpret the findings adequately and appropriately, highlighting the key points concisely, clearly and logically. The findings and their applicability/relevance to the literature stated in a clear and definite manner, The discussion accurate and does it discuss the paper’s scientific significance and relevance

to clinical practice sufficiently. This article draws on a large number of studies and systematically outlines a variety of dietary interventions to provide a wealth of information for the dietary management of patients with inflammatory bowel disease, especially Crohn's disease, while discussing the feasibility and challenges of dietary interventions in practical clinical applications, which has guiding significance for clinicians. However, there are some shortcomings in this paper, and the comments are as follows. 1. Some of the cited studies may be old, and authors can refer to and cite the latest relevant studies to ensure the timeliness and cutting-edge content of the article. 2. Individual differences (such as age, lesion site, disease activity) should be fully considered when discussing dietary therapy, which can increase the discussion on the effectiveness and applicability of different patient groups to provide more personalized dietary recommendations. For example, in the sections on the Mediterranean diet and the low FODMAP diet, the results of the study in the pediatric population were not discussed. 3. In the section of micronutrients and macronutrients, there are only malnutrition screening tools for adults, is there a screening tool for pediatric population? 4. The article lacks an in-depth analysis of each dietary intervention therapy, so the comparative advantages and limitations of different dietary intervention therapies can be further elaborated, such as side effects, sustainability and patient compliance. 5. Dietary therapies can be used to reduce inflammation or improve symptoms in patients with Crohn's disease. The Mediterranean diet has been associated with improved outcomes in inflammatory bowel disease, and potentially reducing its development. EEN and CDED can be used for the induction of remission in Crohn's disease. but these above conclusions lack of innovation and less highlights.

SPECIFIC COMMENTS TO AUTHORS

I found that the article is greatly improved in this revision and further discussion on the practical use of dietary therapies and considered disease location where relevant. importantly, particularly discussing the details on side effects and compliance about dietary intervention therapy.
