**Abstract**

Liver transplant (LT) is the primary treatment for patients with end-stage liver disease. About 25 000 LTs are performed annually in the world. The potential for intraoperative bleeding is quite variable. However, massive bleeding is common and requires blood transfusion. Allogeneic blood transfusion has an immunosuppressive effect and an impact on recipient survival, in addition to the risk of transmission of viral infections and

2018年4月15日 - Cell salvage was used selectively in patients with a high risk of intraoperative blood loss based on preoperatively known predictors: right and repeat hepatectomy. We hypothesized that cell salvage with autologous transfusion after right or repeat hepatectomy would reduce the allogeneic blood transfusion rate.

2018年4月15日 - Perioperative blood loss<sup>1,2</sup> and transfusion<sup>2,3</sup> affect the outcome after liver resection. A perioperative allogeneic blood transfusion rate of 17%<sup>4</sup> to 64%<sup>5</sup> has been reported after hepatectomy. ... Intraoperative cell salvage with autologous transfusion has been widely used in orthopedic, urologic and cardiac surgery.

2017年6月13日 - Intraoperative autologous blood transfusion is a medical procedure involving the recovery of blood lost during surgery and re-infusing it into the patient after rinsing. Intraoperative autologous blood transfusion may resolve the problem of limited blood supply sources and reduce the economic burden on patients.

2013年6月14日 - Intraoperative blood salvage autotransfusion (IBSA) is used in various surgical procedures. However, because of the risk of reinfusion of salvaged blood contaminated by tumor cells, the use of IBSA in hepatocellular carcinoma (HCC) patients undergoing liver transplantation (LT) is
