ABOUT COVER
Editorial Board Member of World Journal of Clinical Cases, Ashraf F Hefny, MD, MSc, Associate Professor, Surgeon, Department of Surgery, College of Medicine and Health Sciences, UAE University, Al Ain 00000, United Arab Emirates. ahefny@uaeu.ac.ae

AIMS AND SCOPE
The primary aim of World Journal of Clinical Cases (WJCC, World J Clin Cases) is to provide scholars and readers from various fields of clinical medicine with a platform to publish high-quality clinical research articles and communicate their research findings online.

WJCC mainly publishes articles reporting research results and findings obtained in the field of clinical medicine and covering a wide range of topics, including case control studies, retrospective cohort studies, retrospective studies, clinical trials studies, observational studies, prospective studies, randomized controlled trials, randomized clinical trials, systematic reviews, meta-analysis, and case reports.

INDEXING/ABSTRACTING
The WJCC is now abstracted and indexed in Science Citation Index Expanded (SCIE, also known as SciSearch®), Journal Citation Reports/Science Edition, Current Contents®/Clinical Medicine, PubMed, PubMed Central, Scopus, Reference Citation Analysis, China National Knowledge Infrastructure, China Science and Technology Journal Database, and Superstar Journals Database. The 2022 Edition of Journal Citation Reports® cites the 2021 impact factor (IF) for WJCC as 1.534; IF without journal self cites: 1.491; 5-year IF: 1.599; Journal Citation Indicator: 0.28; Ranking: 135 among 172 journals in medicine, general and internal; and Quartile category: Q4. The WJCC’s CiteScore for 2021 is 1.2 and Scopus CiteScore rank 2021: General Medicine is 443/826.

**CASE REPORT**

**Prevotella oris-caused meningitis and spinal canal infection: A case report**

Wei-Wei Zhang, Chao Ai, Chien-Tai Mao, Dong-Kang Liu, Yi Guo

**Abstract**

**BACKGROUND**

*Prevotella oris*-induced meningitis and *Prevotella oris*-induced meningitis concomitant with spinal canal infection are extremely rare. To the best of our knowledge, only 1 case of *Prevotella oris*-induced central system infection has been reported. This is the second report on meningitis combined with spinal canal infection due to *Prevotella oris*.

**CASE SUMMARY**

We report a case of a 9-year-old boy suffering from meningitis and spinal canal infection. The patient presented to the neurosurgery department with lumbosacral pain for 1 mo and headache and vomiting for 1 d. He had been treated with cephalosporin and nonsteroidal anti-inflammatory drugs for fever, otalgia and pharyngalgia in a local hospital 2 mo prior to this admission. During hospitalization, magnetic resonance imaging suggested meningitis and L3-S1 lumbosacral dural sac infection. The cerebrospinal fluid and blood cultures were negative, but the cerebrospinal fluid specimen indicated the presence of *Prevotella oris* by metagenomic next-generation sequencing. Previous cases of *Prevotella oris* infection were retrieved from PubMed to characterize the clinicopathological features and identify the prognostic factors and related antimicrobial treatment of infection due to *Prevotella oris*.

**CONCLUSION**

This report shed light on the characteristics of *Prevotella oris* infection and highlighted the role of metagenomic next-generation sequencing in pathogen detection.

**Key Words:** *Prevotella oris*; Meningitis; Spinal canal infection; Metagenomic next-
Core Tip: *Prevotella oris* is an anaerobic, Gram-negative, nonpigmented bacterium that rarely results in central nervous system infection. To date, only 1 case has been reported of *Prevotella oris* causing central nervous system infection. We report a patient who suffered from meningitis and spinal canal infection due to *Prevotella oris*. Metagenomic next-generation sequencing identified the pathogen, although the cerebrospinal fluid and blood cultures were negative. Early detection of pathogens is crucial for patient survival and prognosis. We analyzed the characteristics of *Prevotella oris*-induced infection and found that all patients were male; the most commonly used antimicrobial agent was metronidazole.

INTRODUCTION

Bacterial meningitis and spinal canal infection are not common but can be deadly. They may result in permanent disabilities such as cognitive impairment and learning disabilities, which pose a threat to public health[1,2]. The leading pathogens of bacterial meningitis and spinal canal infection are mainly *Streptococcus pneumoniae* and *Neisseria meningitidis*[3]. *Prevotella oris* is rarely the cause of meningitis and spinal canal infections. There was only one documented case of cervical spinal epidural abscess and meningitis caused by *Prevotella oris* and *Peptostreptococcus micros*[4]. More references are warranted to understand the characteristics of *Prevotella oris*-induced central nervous system (CNS) infection. We presented a case of a 9-year-old male with *Prevotella oris*-induced meningitis and spinal canal infection whose symptoms were relieved significantly after targeted antimicrobial therapy.

CASE PRESENTATION

Chief complaints

A 9-year-old Chinese male presented to the neurosurgery clinic with a complaint of headache and vomiting for 1 d.

History of present illness

The patient had lumbosacral pain for 1 mo prior to this presentation.

History of past illness

Three months prior to admission, the patient presented with fever, otalgia and pharyngalgia and was admitted to a local hospital with a diagnosis of otitis media. He was treated with cephalosporin and nonsteroidal anti-inflammatory drugs (the specific agents and dosages are unknown), and the symptoms were alleviated temporarily. One month later, he had a fever and bilateral muscle pain in the thighs. The pain spread to the whole lumbosacral region. He began to vomit and experienced a progressive headache.

Personal and family history

The patient’s personal and family history were not significant.

Physical examination

Physical examination showed that his body temperature was 38 °C, pulse rate was 110 beats per min, respiratory rate was 19 breaths per min and blood pressure was 120/62 mmHg. His consciousness was clear but exhibited despondency. Neurological examinations revealed that his meningeal irritation sign was negative and other functions were normal.

Laboratory examinations

A routine blood examination revealed 12990 leukocytes/µL (79% neutrophils) and procalcitonin was
0.099 ng/mL. The cerebral spinal fluid (CSF) was colorless and clear, and the leukocyte count was 985 cells/µL with 89% polymorphonuclear leukocytes. The CSF glucose was 2.33 mmol/L, the CSF chloride was 114 mmol/L, and the total protein was 962 mg/L. The CSF and blood cultures were negative.

**Imaging examinations**

Brain magnetic resonance imaging (MRI) revealed hydrocephalus, and there were multiple intracranial meningeal thickening areas and mastoiditis on the left side (Figure 1). In addition, spinal MRI showed that the dura in the thoracolumbosacral spinal canal (mainly in the lumbar segment) was unevenly thickened, and there were scattered small nodular hypointense foci in the spinal canal at the level of the L3-S1 vertebral body, with the largest being approximately 5 mm (Figure 2).

**FURTHER DIAGNOSTIC WORK-UP**

To investigate the pathogenic microorganisms, a CSF specimen was tested using metagenomic next-generation sequencing (mNGS). The results showed the presence of *Prevotella oris* with a sequence number of 630 copies and a relative abundance of 1.81%.

**FINAL DIAGNOSIS**

The patient was diagnosed with meningitis and L3-S1 lumbosacral dural sac infection.

**TREATMENT**

Initially, the patient was empirically treated with intravenous vancomycin (40 mg/kg/d in two divided doses) and meropenem (40 mg/kg every 8 h). He also underwent a puncture and external drainage of the right ventricle and was given intracranial pressure-decreasing agents and systemic nutritional support. His symptoms did not improve. After the mNGS results indicated the presence of *Prevotella oris*, antibiotic therapy was changed to intravenous metronidazole (15 mg/kg every 6 h) and meropenem (40 mg/kg every 8 h) for 2 wk, followed by meropenem (40 mg/kg every 8 h) for another 2 mo due to the patient experiencing a metronidazole-induced gastrointestinal reaction.

**OUTCOME AND FOLLOW-UP**

The patient’s temperature returned to normal, and his symptoms improved significantly with targeted antimicrobial therapy. After 1 mo of treatment, the routine blood examination showed that the leukocyte count and the percentage of neutrophil granulocytes returned to normal. The leukocyte count in the CSF was 66 cells/µL with 33% polymorphonuclear leukocytes. The CSF glucose was 3.11 mmol/L, the CSF chloride was 117 mmol/L, and the total protein was 560 mg/L. Brain and spinal MRI showed that the thickening of the intracranial and lumbosacral dura mater was greatly resolved. The ventricular drainage catheter was pulled out. The patient was continuously treated for another month and followed up for 2 mo without recurrence.

**DISCUSSION**

CNS infections are potentially devastating and disabling infectious diseases worldwide. They include meningitis, encephalitis, spinal and cranial abscesses, discitis and other complications. It is estimated that the global incidence of CNS infections was 389/100000 between 1990 and 2016[5]. Although CNS infections are not common in developed countries, they remain a public health problem in developing countries[5,6]. Bacterial infections are one type of CNS infection and can be frequently caused by *Haemophilus influenzae*, *Streptococcus pneumoniae*, *Neisseria meningitidis*, Group B strep and *Listeria monocytogenes* in children[7].

*Prevotella oris*, a nonpigmented, anaerobic, Gram-negative, rod-shaped bacterium, is a periodontopathogen and frequently detected in periodontal diseases[8]. We retrieved and reviewed previous cases of *Prevotella oris* causing extraoral infection from the PubMed database (Table 1). *Prevotella oris* was reported as a pathogen in pleural infection, bacteremia, hepatic abscess, pericarditis, mediastinitis, sepsis and empyema. Only 1 case reported cervical spinal epidural abscess and meningitis due to *Prevotella oris* and *Peptostreptococcus micros* after retropharyngeal surgery in 2004[4]. Upon review, we found that the patients all reported cases were male, and 2 of the 7 cases were initially diagnosed as a...

COVID-19: Coronavirus disease 2019; IV: Intravenous; NA: Not available; M: Male.

...tuberculosis infection, which indicated that the symptoms of *Prevotella oris*-induced infection may not be specific and may be similar to tuberculosis infection.

In this case, the patient did not show significant meningitis or spinal infection symptoms. His meningeal irritation sign was negative, and the glucose level of the CSF was within the normal range. Both his blood and CSF cultures were negative. All these factors make pathogen identification more difficult. To investigate the pathogen, we used mNGS, a promising and clinically validated test for CNS infections[9].

Traditional blood and CSF bacterial cultures are essential laboratory tests in meningitis and spinal canal infection. They rarely detect pathogens effectively and in a timely manner under certain circumstances, such as infections caused by oral flora[10]. Compared to traditional methods, mNGS can improve the detection of pathogens to aid clinicians with a timely diagnosis. Some researchers have...
Zhang et al. *Prevotella oris*-caused CNS infection

**Figure 1** Brain magnetic resonance imaging sequences of the patient. A: Contrast-enhanced T1-weighted imaging; and B: T2-weighted imaging.

**Figure 2** Spinal magnetic resonance imaging sequences of contrast-enhanced T1-weighted imaging of the patient.

validated the effects of mNGS in CNS infections[11,12]. It can also provide guidance for clinicians in choosing appropriate antimicrobial regimens.

To date, antimicrobial treatment recommendations have been lacking for *Prevotella oris*-induced nervous system infection. By reviewing previous case reports, we found that the most commonly used antibiotic for treating *Prevotella oris*-induced infection was metronidazole, while other antibiotics included piperacillin-tazobactam, ampicillin/sulbactam, levaquin, ertapenem, ciprofloxacin and ceftriaxone. For the documented *Prevotella oris*-induced and *Peptostreptococcus micros*-induced cervical spinal epidural abscess and meningitis cases, fosfomycin, ceftriaxone and metronidazole were used for targeted therapy (Table 1). According to the European Committee of Antimicrobial Susceptibility Testing guidelines, *Prevotella oris* was susceptible to metronidazole, imipenem, chloramphenicol and cefoxitin discs[13]. For this patient, we used metronidazole and meropenem to treat the infection after we found that the effect of empirical antimicrobial therapy was unsatisfactory. The infection was controlled in a timely and effective manner.

**CONCLUSION**

To the best of our knowledge, this is the second report of meningitis combined with spinal canal infection due to *Prevotella oris*. Despite its rarity, *Prevotella oris* may cause meningitis and spinal canal infection. The symptoms of this kind of infection may not be typical, and conventional culture tests have difficulty detecting pathogens. mNGS is a promising technique to identify pathogens under such circumstances. Clinicians should be aware of this possibility and treat it with rapid imaging, neurosurgical intervention and targeted antibiotics.
