Patients with end-stage liver disease often experience serious complications. The risk of bleeding during invasive procedures in patients with chronic liver disease is associated with platelet count, coagulopathy status, and the type of procedure. Recombinant human thrombopoietin is commonly used to treat primary immune thrombocytopenic purpura and immune thrombocytopenia caused by solid tumor chemotherapy; however, there are few reports on the use of recombinant human thrombopoietin in the treatment of chronic liver disease-related thrombocytopenia. This study is designed to analyze the efficacy of recombinant human thrombopoietin for the treatment of chronic liver disease-related thrombocytopenia to provide a reference for clinical treatment. The study is very well designed. The inclusion and exclusion criteria are reasonable, and described in detail. The results are interesting and well discussed. After a minor revision, this manuscript can be accepted for publication. Comments: 1. The manuscript requires a minor editing. Some minor language polishing should be revised. 2. Some data in the results section is repeated with the data in tables. Please check and make a revision. 3. A conclusion should be made in the main text. 4. Tables and figure are good. A minor editing to the tables is necessary.

SPECIFIC COMMENTS TO AUTHORS
This is an interesting study of the efficacy of recombinant human thrombopoietin in the treatment of patients with CLD-associated thrombocytopenia undergoing invasive procedures. The study is well performed and the results are interesting. The manuscript is overall well written. A minor editing is required before final publication. I have no specific comments to the authors. Thank you very much.
