Epidemiology of liver failure - ScienceDirect

<https://www.sciencedirect.com/science/article/pii/S2210740111001227>

Mini review **Epidemiology of liver failure**. Paracetamol has now overtaken viruses (particularly **hepatitis B virus**) as the leading cause of fulminant **hepatitis**. Establishing the cause of **fulminant hepatitis** is an important step in the management of **acute liver failure**, so that specific therapy can be initiated and any contraindications to **liver** transplantation be eliminated.

Jul 17, 2010 · **Acute liver failure** is a rare disorder with high mortality and resource cost. In the developing world, viral causes predominate, with hepatitis E infection recognised as a common cause in many countries. In the USA and much of western Europe, the incidence of virally induced **disease** has declined substantially in the past few years, with most cases now arising from drug-induced **liver** injury

Mar 18, 2008 · Epidemiology of acute liver failure. Abstract Acute liver failure (ALF) is an uncommon disorder that leads to **jaundice**, **coagulopathy**, and **multisystem organ** failure. Its definition is based on the timing from onset of **jaundice** to **encephalopathy**. In 2005, ALF accounted for 6% of liver-related deaths and 7% of orthotopic **liver** transplants (OLT)...

Acute liver failure

Disease

Acute liver failure is the appearance of severe complications rapidly after the first signs of liver disease, and indicates that the liver has sustained severe damage. The complications are hepatic encephalopathy and impaired protein synthesis. The 1993 classification defines hyperacute as within 1 week, acute as 8–28 days, and subacute as 4–12 weeks. It reflects the fact that the pace of disease evolution strongly influences prognosis. Underlying cause is the other significant determinant of outcome.
