COMMENTS TO AUTHORS

This well written paper could be further upgraded by more extensive discussion of the following issues: 1.) The role of submucosal injection as an aid or an impediment for a complete resection 2.) The role of rf-surgery for correct assesment of a R0 Resection. Depth of coagulation zone as an artifact for the pathologist or a positive factor for complete resection? 3.) The imperative need for to tattooing the site of resection 4.) The possibility of performing a full thickness resection with conventional instruments (without the expenditure of a TEM-procedure) and closing the defect with new clips (OTSC).
