Unexpected Encounter of the Parasitic Kind

Holly Matthews, Florian Noulin

Abstract

Both parasitology and stem cell research are important disciplines in their own right. Parasites are a real threat to human health causing a broad spectrum of diseases and significant annual rates morbidity and mortality globally. Stem cell research, on the other hand, focuses on the potential for regenerative medicine for a range of diseases including cancer and regenerative therapies. Though these two topics might appear distant, there are some “unexpected encounters”. In this review, we summarize the various links between parasites and stem cells. Firstly, we discuss how parasites’ own stem cells represent interesting models of regeneration that could be translated to human stem cell regeneration. Secondly, we explore the interactions between parasites and host stem cells during the course of infection. Thirdly, we investigate from a clinical perspective, how stem cell regeneration could be exploited to help circumvent the damage induced by parasitic infection and its potential to serve as treatment option for parasitic diseases in the future. Finally, we discuss the importance of screening for pathogens during organ transplantation by presenting some clinical cases of parasitic infection following stem cell therapy.
