Retrospective Cohort Study

1 Does autologous blood transfusion during liver transplantation for hepatocellular carcinoma increase risk of recurrence?

Raphael LC Araujo, Carlos Andrés Pantanali, Luciana Haddad, Joel Avancini Rocha Filho, Luiz Augusto Carneiro D'Albuquerque, Wellington Andraus

Abstract

AIM: Analyze outcomes **17** in patients underwent liver transplantation (LT) for hepatocellular carcinoma (HCC) who received autologous Intraoperative Blood Salvage (IBS).

METHODS: Consecutive HCC patients undergone LT were studied retrospectively and analyzed according to the use or not of IBS. Demographics and surgical data were collected from departmental prospective maintained database. Statistical analyses were performed using the Fisher's exact test and the Wilcoxon rank sum test to examine covariate differences between patients who underwent IBS or not. Univariate and Cox regression models were developed for recurrence and death, as well as survival
