SPECIFIC COMMENTS TO AUTHORS
This manuscript reports a patient with early seminoma who was subsequently identified to have a recurrence two decades later. The authors performed a brief case report and literature review and emphasized the imperative of a multidisciplinary approach to sub-professional expert consultation and patient education. This study is interesting, late relapses of localized pure seminoma a rare and ultimately little studied. However, in the author's description, there is no detailed suggestion for a multidisciplinary discussion. In addition, treatment and follow-up were not described in detail. It is unclear whether the patient's symptoms have improved after treatment. Why did the author choose a chemotherapy regimen with lower intensity?
