COMMENTS TO AUTHORS

The article reports a case of a patient who developed a squamous cell carcinoma 7 years after liver transplant following the change of immunosuppressive therapy. It is interesting but I find it will be useful to enter more details concerning the histology and surgery performed. The language is not particularly fluent and should be reviewed. The discussion is appropriate and complete.

COMMENTS TO AUTHORS

1) This report introduced that de novo malignancies and particularly skin cancer are long term complications of Liver transplantation (LT). Non melanoma skin cancer is the most common malignancy (NMSC) among the LT recipients with an overall incidence of 16% to 22.5%. 2) I suggest that the article can be published in the form of case report in world J Hepatology.
