## Cytomegalovirus infection after liver transplantation

Lizaola-Mayo BC *et al.* CMV infection after liver transplantation

Blanca C Lizaola-Mayo, Eduardo A Rodriguez

### Abstract

Human cytomegalovirus (CMV) represents the most common opportunistic infection in liver transplant recipients. CMV infections in post liver transplant patients cause significant morbidity and mortality, directly affecting post-transplant outcomes. This review will provide the framework for the surveillance, diagnosis, prophylaxis and treatment of CMV in the liver transplant population.
