The authors of the minireview summarized the characteristics of stem cell-like memory T cells and their role in viral infections and autoimmune diseases based on recent literature data. The facts described are basically correct, understandable, and summarize the available data on the subject. However, one important aspect needs to be further elaborated: what are the antiviral and immunotherapeutic (including CAR-based) potentials of Tscm cells?

**SPECIFIC COMMENTS TO AUTHORS**

This article discusses the contrasting roles of stem cell-like memory T (TSCM) cells during chronic viral infections and autoimmune diseases. During chronic viral infections, such as HIV-1, the TSCM cells serve as reservoirs for latent viruses, which can be activated to make them susceptible to cytotoxic T cell responses. However, during acute viral infections, the TSCM cells have the ability to replenish the diminished effector T cell population. In autoimmune diseases, like type-1 diabetes, these cells contribute to the disease pathogenesis by persistent generation of autoreactive effector T cells. A better understanding of the key signaling pathways and mediators regulating TSCM cells could lead to novel approaches to target or manipulate these cells for immunotherapeutic applications. The content of this manuscript is interesting. We believe this manuscript is valuable for all the researchers who are interested in the contrasting roles of stem cell-like memory T (TSCM) cells during chronic viral infections and autoimmune diseases. This study focuses on current research hot spots and frontiers, which is very important for subsequent research. The article also puts forward the current problems and future research directions. Therefore, I recommend accepting and
publishing this manuscript.
