Treatment of oral lichen planus by surgical excision and acellular dermal matrix grafting: A case report

Treatment of OLP and ADM Grafting

Abstract

BACKGROUND

Oral lichen planus (OLP) is a chronic inflammatory disorder and it can affect normal oral function. The conventional treatments for OLP are not always effective and relapse easily occurs. Therefore, treatment of OLP is difficult and challenging. In this study, we evaluated over a long period the clinical efficacy of surgical excision and acellular dermal matrix (ADM) grafting in patients with refractory OLP.
